PortalPulse reviewer guide

1. Current implementation and real observations

4 November 2026 | Node Operations & Tooling | Builder JokerFuFu

PortalPulse records network progress and correlates transaction facts through inclusion, execution, linked finality and caller-specific state. The public webpage reviews portable reports. Node CLIs collect official V3 observations. Probe deployment and a new live update remain pending.

Evidence	Recorded result
4 Nov official V3 monitoring	4 samples, 36/36 readonly requests succeeded. Collection exit 0, status normal.
3 Nov historical transaction	Native inclusion 299780, RPC finalized head 299784, four checked parent links. Probe event/state absent; exit 2.
Complete probe path	Artificial fixtures, including local HTTP. 594 full-suite tests passed on 3 Nov at 6059a1d.
4 Nov local compilation	384-byte creation / 352-byte runtime. Output matches the 22 Oct artifact byte for byte.

Four real samples

UTC on 4 Nov	Best block	Finalized block
02:08:16.520	314148	314146
02:08:36.444	314151	314149
02:08:56.229	314154	314152
02:09:21.268	314159	314157

Genesis matched the operator-selected, organizer-source configuration. Runtime spec 3002, transaction version 2. Identity matching uses the selected source; independent consensus and storage proofs remain outside this checkpoint.

Replay retains the original date and trust scope

The monitor report replays offline with verifiedNetwork=false. At the captured replay on 4 Nov, freshness was abnormal because the last observation was already stale. Import exit 0 confirms schema/digest validity and preserves that abnormal result.

```
Monitor payload SHA-256
6928a59da42505e5b7dbdf20364d202c
1a59e44caac9b4f4d95785b5a4fa8c34
```

2. Reproduce the CLI and webpage review

4 November 2026 | Node Operations & Tooling | Builder JokerFuFu

Use Node.js 22.12 or later. The 4 Nov command captures used Node 24.22.1. Install the lockfile dependencies, including development dependencies, from a clean checkout. Each output path must be new.

```
npm ci --ignore-scripts
npm run build:core
node dist/cli/main.js execution-demo --scenario complete
node dist/cli/main.js execution-demo --scenario state-mismatch
```

Scenario	Status	Exit
complete	normal	0
missing-evidence	unverified	2
execution-failed	abnormal	1
wrong-transaction	abnormal	1
unfinalized	unverified	2
state-mismatch	abnormal	1

All six scenarios are synthetic, mode=offline. verifiedNetwork, writeAllowed and fullVerification remain false. The exact sequence 9007199254740993 is stored as a decimal string.

Import the historical RPC report

```
node dist/cli/main.js execution-inspect --input \
  docs/evidence/probe-readback-historical-report-20261103.json
```

Expected exit 2 and status unverified. This report contains a public historical native transaction. Contract and caller are zero-address placeholders. Submission, matching probe execution and caller-state evidence are absent.

Review in the webpage

Open the public console, choose execution review and load one of the six rehearsals. Compare complete, missing evidence, failed execution and state mismatch. To inspect RPC history, paste the historical execution-report JSON and review its original timestamp, ancestry, missing stages and digest.

The exported monitor report belongs to the network-observation importer. The historical execution report belongs to execution review. The two schemas have separate import paths. File downloads, report printing and six-case webpage behavior were accepted in the October releases; new GUI printing was not repeated for this material refresh.

3. Real-probe completion and submission evidence

4 November 2026 | Node Operations & Tooling | Builder JokerFuFu

Wallet and deployment

Select the actual wallet account, verify its native/H160 mapping, then refresh test funds and fee estimates. Review a finite storage-deposit bound for that account and transaction. The 27 Oct candidate estimate of 40.566 tPOT and cap of 81.132 tPOT are historical preflight values; the final participant budget is pending.

Compile the pinned Solidity 0.8.24 / Paris / optimizer-200 artifact. The participant signs deployment and record(uint64). Preserve the new contract H160, native inclusion/extrinsic hashes, caller H160, exact sequence, wallet submission time and transaction receipt.

Collect shortly after native Revive inclusion

```
node scripts/observe-probe.mjs \
  --config examples/portaldot-v3-config-20261022.json \
  --evm-endpoint https://test-evm-rpc-v3.portaldot.dev \
  --block-hash "$NATIVE_BLOCK_HASH" \
  --tx-hash "$NATIVE_EXTRINSIC_HASH" \
  --contract "$PROBE_H160" --caller "$CALLER_H160" \
  --expected-sequence "$SEQUENCE_DECIMAL" \
  --submitted-at "$SUBMITTED_AT_UTC" \
  --out probe-report.json > probe-collection.json
```

Use values from the participant transaction. Collection checks exact event phase/caller/sequence, up to 32 native parent links and EVM block-hash-pinned code and state. Retain both files. CLI exit 0 describes complete supplied evidence; 1 indicates abnormal/error; 2 indicates missing evidence. Offline reports keep all three verification/write flags false.

Submission state and remaining records

Item	Current record
Check-in	Submitted 20 Oct as Build 50050. Original readback Under Review. Organizer approval remains unconfirmed.
Final submission / freeze	6 Nov 2026, 04:00 UTC / 12:00 Asia/Shanghai, last read on the official page 3 Nov. Platform final readback pending.
Demo Day	8-9 Nov UTC dates. Participant slot remains unconfirmed.
Remaining live proof	Selected signer and budget, new probe deployment and update, exact finalized caller-state evidence and final platform receipt.

The captioned CLI video uses actual recorded outputs and clearly identified synthetic cases. It is an edited output-snapshot walkthrough. Final media should add the real participant-probe evidence after wallet signing.
